vacation

A stay-cation is a period in which an individual or family stays home and participates in leisure activities. Stay-cations achieved popularity in the US during the financial crisis of 2007–2010. Stay-cations also became a popular phenomenon in the UK in 2009 as a weak pound made overseas holidays significantly more expensive.

Staying at home is the most effective way to protect yourself from the epidemic. CFP

21st Century  
**Teens**

The recent outbreak of the novel coronavirus pneumonia (NCP) has led to some serious measures as governments and health organizations work to keep it under control. The **prevention** of *infectious* (传染性的) diseases is no joke, and it's being taken seriously around the world.

The most serious (and effective) measure taken so far has been to limit and discourage people from gathering in crowded spaces. Many *residential complexes* (住宅小区) have even *issued* (发放) limited permits for each household to exit and enter the neighborhood. This means some people have spent weeks at home. Perhaps this includes you.

But these measures are necessary. Jiang Rong-meng, a member of China's National Health Commission expert group, said in a Feb 4 press con-

ference that the novel coronavirus is **transmitted** mainly by coughing and *sneezing* (打喷嚏). These can contaminate the air and shared objects like elevator buttons around an infected person. This makes your home the safest place to be.

If you must go out, there are basic *hygienic* (卫生的) practices you should follow. The World Health Organization (WHO) says first, people should wash their hands frequently. This is especially necessary before you touch your eyes, mouth or nose. "Washing your hands with soap and water ... *eliminates* (清除) the virus if it is on your hands," says the WHO website. By touching these places on your face, you **risk** transmitting a virus to yourself.

You can trust yourself, but maybe not everyone else. We've all seen that lady on the bus cough

without covering her mouth. This is a health risk at any time, but especially now. If you must cough or sneeze, the WHO says to do it into your bent *elbow* (手肘). If you use your hands, you should wash them as soon as possible and avoid touching others. Speaking of other people, the WHO also **recommends** staying at least one meter away from them.

The great thing about staying home and avoiding people is that you don't need to worry quite so much about coughers or sneezers really near you. Hopefully, this will not have to last long. But then, if you, your friends and your parents continue to practice these basic hygiene habits in your daily lives, we will have a safer and healthier society.
